

AnimusCore — 5-Year Financial Audit (₹17.87 Cr Target)

Prepared: 2026-09-25

Scope: Institutional CFO / enterprise HFT infrastructure sales audit of the ₹17.87 Cr, 5-year liquid net worth target modeled in docs/financial_architecture/index.html, re-tested against realistic enterprise sales-cycle dynamics for the named target account list.

Nature of this document: Informed industry-judgment modeling (deal-cycle norms, enterprise pricing structures, HFT security-review practices), not verified facts about the internal budgets, procurement policies, or vendor-adoption plans of any named firm. Treat all figures as planning estimates, not disclosed or confirmed data from those firms.

Executive Verdict

The ₹17.87 Cr target is **not an enterprise-sales forecast — it's a personal-lifestyle-tier assumption wearing a business plan's clothes**. ₹15.70 Cr of it (88%) comes from the founder-draw waterfall in financial_architecture/index.html, which assumes \$20k/mo of business revenue exists *today*, scaling to \$120k/mo by Year 5 — with **zero contracts** behind that figure. The remaining ~₹4.32 Cr of "enterprise deals" layered on top in the prior forecast panel were illustrative placeholders, not actual pipeline.

Re-running the numbers as a genuine B2B enterprise infrastructure sale into the actual named 9-account target list, with real sales-cycle physics (evaluation periods, security/code audits, sandboxed backpressure testing, net-60/90 payment terms) produces a materially different picture:

Even at a 100% win rate on every single named account, on an aggressive-but-plausible timeline, the ₹17.87 Cr target is not reached within 5 years. Best case lands around ₹13.2 Cr. A realistic (still optimistic) win rate lands around ₹4–7 Cr — 25–40% of the stated target.

1. Tier Pricing — Core License vs. Annual Production Colocation Retainer

Segment	Accounts	Core License (Annual)	Annual Production Colo Retainer	Total ACV
Domestic Prop Desk	AlphaGrep, Graviton, iRage, Quadeye	\$45,000	\$15,000 (33%)	\$60,000
Domestic Enterprise	Tower Research (India engineering site)	\$180,000	\$60,000 (33%)	\$240,000
Global Market Maker	Wintermute, Flow Traders	\$400,000	\$150,000 (37.5%)	\$550,000
Global Tier-1 HFT/Prop	Jump Trading, Jane Street	\$400,000	\$150,000 (37.5%)	\$550,000 (see risk note)

The Retainer line is a cost center for the vendor too (dedicated benchmark/regression box access, priority patching, a named support contact) — see Section 3.

Risk-adjustment on Jane Street: OCaml-first, build-everything-in-house culture, no known precedent of licensing third-party native C++ trading infrastructure from an unproven single-founder vendor. Included in the pricing table for completeness; assigned near-zero realistic close probability inside a 5-year window.

2. Quarterly Revenue & Cash Collection — Best-Case Scenario

Assumptions: 100% win rate across all 9 named accounts. First outbound to all 5 domestic accounts (iRage, AlphaGrep, Quadeye, Graviton, Tower) went out 2026-09-24/25 — Day 0–1 as of this audit. Jump Trading and Jane Street are live in a separate, less-advanced outbound motion. A 6–9 month evaluation window plus security/code audit, sandboxed backpressure testing, and legal/procurement realistically puts the earliest possible signature in **Year 1, Quarter 4**, for the single fastest-moving small prop desk. Larger and global accounts take longer, not shorter — HFT security review does not compress under founder urgency. Cash collection is modeled one quarter behind revenue recognition (net-60/90 approximation).

Qtr	Signing this quarter	Active ACV run-rate	Revenue recognized	Cash collected
Y1 Q1	—	\$0	\$0	\$0
Y1 Q2	—	\$0	\$0	\$0
Y1 Q3	—	\$0	\$0	\$0
Y1 Q4	iRage signs	\$0 (live from Q5)	\$0	\$0
Y2 Q1	—	\$60k	\$15k	\$0
Y2 Q2	AlphaGrep signs	\$60k	\$15k	\$15k
Y2 Q3	—	\$120k	\$30k	\$15k
Y2 Q4	Quadeye signs	\$120k	\$30k	\$30k
Y3 Q1	—	\$180k	\$45k	\$30k
Y3 Q2	Graviton signs	\$180k	\$45k	\$45k
Y3 Q3	—	\$240k	\$60k	\$45k
Y3 Q4	Tower signs	\$240k	\$60k	\$60k
Y4 Q1	Wintermute signs	\$480k	\$120k	\$60k
Y4 Q2	—	\$1,030k	\$257.5k	\$120k
Y4 Q3	Flow Traders signs	\$1,030k	\$257.5k	\$257.5k
Y4 Q4	—	\$1,580k	\$395k	\$257.5k
Y5 Q1	Jump Trading signs	\$1,580k	\$395k	\$395k
Y5 Q2	—	\$2,130k	\$532.5k	\$395k
Y5 Q3	Jane Street signs	\$2,130k	\$532.5k	\$532.5k
Y5 Q4	—	\$2,680k	\$670k	\$532.5k

Annual Rollup

Year	Revenue Recognized	Cash Collected
Y1	\$0	\$0
Y2	\$90k	\$60k
Y3	\$210k	\$180k
Y4	\$1,030k	\$695k
Y5	\$2,130k	\$1,855k
5-Yr Total	\$3.46M	\$2.79M

Note the \$670k gap between the two totals: Q20's revenue has not converted to cash by the end of Year 5 — it is still in net-60/90 transit into Year 6. **Revenue recognized and cash in hand are not the same number, and only cash compounds.**

\$2.79M cash collected @ ₹90/\$1 = **₹25.11 Cr gross, best case, 100% win rate on every named account.**

3. Unmodeled Opex — Costs the Original Model Never Included

financial_architecture/index.html was built around a solo operator with only cloud infra, a CA/compliance retainer, vehicle lease, and fuel allowance — no engineering headcount, no compliance spend. That cost structure is incompatible with actually selling into Tier-1 HFT shops.

Item	Timing	Est. Annual Cost	5-Yr Impact
Senior systems support engineer (fully loaded)	Hired Year 3	₹1.2 Cr/yr (~\$135k)	₹3.6 Cr (Y3–Y5)
Dedicated colo/benchmark boxes (2–4 accounts)	From Year 3	~₹30–50L/yr	~₹1.5 Cr
Initial SOC 2 Type II audit (or equivalent)	Required before a Year 1 close is realistic at all	~\$50k one-time (₹45L)	₹0.45 Cr
Annual SOC 2 recertification	Y3–Y5	~\$25k/yr	₹0.8 Cr
Total unmodeled opex			~₹6.35 Cr

Recomputed Realistic Grand Total

Applying 22% corporate tax to the ₹25.11 Cr gross (best case) and subtracting the unmodeled opex above:

₹25.11 Cr (gross cash collected, 100% win rate)
– ₹5.5 Cr (22% corporate tax)
– ₹6.35 Cr (unmodeled opex: engineer, colo, SOC 2)
≈ ₹13.2 Cr realistic BEST-CASE retained treasury

Against the ₹17.87 Cr target, **this is the ceiling** — the outcome only if every one of the 9 named accounts closes, with zero churn, on an aggressive timeline.

Applying a realistic (still optimistic, given zero reference customers) **35–45% weighted win rate** instead of 100% collapses this to **roughly ₹4–7 Cr** — 25–40% of the stated target.

Exact Contract Count Required to Actually Hit ₹17.87 Cr

Working backward: hitting the cash-collected equivalent of ₹17.87 Cr (after the same tax/opex drag, this requires roughly **\$5.5–6M gross cash collected**) at a blended realistic ACV (~\$300k across the tier mix) requires approximately **18–20 concurrent, fully-active, non-churned enterprise contracts by Year 5** — more than **double the entire current 9-account named target list**, all closed, all retained, on top of the SOC 2 audit and support-engineer hire being funded and operational well before Year 3.

Conclusion: as scoped to this exact 9-firm list, the ₹17.87 Cr target is not reachable in 5 years even at a 100% close rate. Reaching it requires either (a) expanding the target account list to 18–20+ similarly-sized firms, or (b) recutting the target itself.

4. Single Biggest Point of Failure Before Year 3

Zero reference customers.

Every one of these 9 firms runs security/code review before any third-party component touches a production trading path. No security team at AlphaGrep, Tower, Wintermute, or Jump approves a vendor with no SOC 2 report, no existing paying enterprise logo, and a single-founder support structure — regardless of benchmark quality (sub-20ns fast path, invariant-TSC cycle counters, zero heap allocations all included).

This is not a pricing problem and not primarily a sales-cycle-length problem. It is a **trust-artifact problem that blocks the sales cycle from ever starting the clock**. Outbound to all 5 fastest-moving domestic accounts only went out in the 48 hours preceding this audit, with zero prior relationship in any case. Without landing one reference-able logo — even a small one, even at a discount — every subsequent deal in this pipeline stalls in evaluation indefinitely, and the Year 3+ dates in the schedule above do not occur at all.

This audit supersedes the illustrative "Five-Year Capital Trajectory" forecast panel added to docs/financial_architecture/index.html for the purpose of GTM/revenue planning — that panel's enterprise-deal defaults (2 Desk License + 1 Enterprise SLA + 1 OEM-Redistribution) should be treated as placeholders, not as validated targets, until at least one signed contract exists.
